Electra Air Cooled Heat Sink

Manufacturer: -

Electra Air Cooled Heat Sink CO606 Special Order: Please allow extra time for shipping. Optional Air cooling tube for Electra CO2 Generators. Electra 48 uses 2 Heat Sinks. Carbon dioxide generators operate by burning carbonaceous fuels such as propane or natural gas. The burners used in Green Air Products CO2 generators are specially designed to maximize the production of CO2 and minimize heat as a by-product. Green Air Products generators provide CO2 far more economically than any other means of enrichment. An electronic igniter is used to strike a flame when the generator is turned on. If the burner flame is lost the valve will close so that unburned fuel will not be released into the enclosure. CO2 Generator operations may be automatically functioned according to actual ambient values when installed in conjunction with the SPC-1 or CDMC CO2 controllers. This control device continually samples the level of carbon dioxide in the growing area and functions the generator whenever CO2 levels do not meet your predetermined values. Generators are easily installed, dependable and efficient. Transformer included. Operates on 110 VAC.
