## X Nutrients Bloom Spray (5 Gallon)

Model: dl-XNHBLSP-5GA

X Nutrients Bloom Spray (5 Gallon)

Manufacturer: -

X Nutrients Bloom Spray (5 Gallon) (XNHBLSP-5GA) The flowering or fruit stage of a plant is the most satisfying. This is the time when all the hard work starts to pay-off. Along with changing a plants environment, you should change its nutrients. Bloom Spray is specifically designed for the flowering and fruit stage. Its unique combination of fertilizer and trace elements help provide the exact nutrient levels a plant needs to transform itself when producing flowers and fruit. Bloom Spray is a power packed concentrated spray that is applied to the leaves during flowering or fruit stages. The added trace elements maximize flower or fruit size. Bloom spray can be used for both soil and hydroponic systems at the same time as other nutrients. Within weeks you will see explosive flowering, fruit density and higher yields. Available in 1 Quart 1 Gallon 2.5 Gallons 5 Gallons Refer to feeding schedules for amounts and usage. General Usage: Hydroponics or Soil/Coco/Other medium - 15 mL per liter of water to make a spray. Spray leaves on top and bottom twice a week. Specific Usage: Hydroponics or Soil/Coco/Other medium - Refer to the feeding schedule for week by week amounts to use. X Nutrients Bloom Spray helps your plants produce more and larger fruits and flowers. It super feeds your plants with added NPK during the flowering portion of your cycle for a more abundant crop. One of the most effect ways of feeding a plant is through its foliage. Grow Spray is applied directly to the top and bottom of the plant's leaves. Absorption of the nutrient elements occurs through the stomata and epidermis. Research has shown that the rate of absorption and movement of nutrients throughout the plant through foliar feeding can be as fast as one foot per hour to all parts of the plants. Foliar feeding should be done early in the morning or just as the lights are coming on. X Nutrients Bloom Spray is packed with macro nutrients and even has a water based penetrating agent built into the formula so it's ready to use, just mix with water and spray. The wetting agent, also known as a surfactant, helps a plant to absorb the nutrients by reducing the surface tension of the liquid. When applying Bloom Spray, use a fine misting. You do not want to over saturate your plants. If you are in a high humidity area, make sure you have good air circulation; this will ensure your environment does not become stagnant or become too wet. The recommended temperature for spraying is around 80 degrees. For optimal results, spray both the tops and bottoms of the leaves. X Nutrients Bloom Spray can be used alongside other nutrient products. We recommend using our Grow, Micro, and Amino Blast with Grow Spray. It can be used indoor and outdoor in all systems and with all mediums. Bloom Spray will help with the production of larger greener foliage and more abundant fruit and flowers. Bloom Spray is designed to help a plant during the flowering and fruiting stage and is formulated high in nitrogen and potassium providing an essential element in the flower production of that plant. Since the absorption and nutrient distribution rates are extremely high when foliar feeding, the plant has immediate access to nutrients. Within several hours, even a large plant will have been fed. Bloom Spray can compensate for a number of NPK deficiencies. Since it is applied directly to the leaves, it is not reliant on the pH of the soil or hydroponic system. Improper pH can cause deficiencies by not allowing absorption of essential elements through a plants root system. Bloom Spray has helped many gardeners compensate for these deficiencies. It can also increase the plants nutrient uptake through the roots by creating a healthier more robust plant when added to your nutrient regimen. Although there are many systems and methods for growing, great growers never stop learning. We have had everyone from beginners to top notch growers use our Grow Spray in side by side testing and the results have been astounding. Gardeners have noted a consistant 10% increase in the plants yield when adding Bloom Spray to their nutrient feeding. Don't take our word for it, visit our Facebook page ([www.facebook.com/hydroponix](http://www.facebook.com/hydroponix)) and hear directly from growers who have X-perienced our products. Bloom Spray is competitively priced; no gouging the customer, and no skimping on ingredients. We provide quality at a very affordable price. Bottom line, try Grow Spray and you will be amazed at the results!
